# Top 40 Java Web Services Interview Questions And Answers

Web services interview questions are mostly asked in Software development Positions. We have already shared the frequently asked core java interview questions and tricky java interview questions.
So  below are the answers to the frequently asked web services interview questions.

## Q1  What are web services ?

According to oracle docs, web services can be defined as

*Web services are client and server applications that communicate over the World Wide Web's (WWW) HyperText Transfer Protocol (HTTP). Web services provide a standard means of inter operating between software applications running on a variety of platforms and frameworks.*

Main characteristics of the Web Services  are :

1. Interoperability
2. Extensibility
3. Machine processable descriptions.

for example in simple words , when we call somebody so the person dialing and calling is the client  application , while person receiving the call is server application and "hello" word is the protocol as similar to HTTP request .

## Q2 What is the difference between SOA and a web service?

SOA (Service-Oriented Architecture) is an architectural pattern that makes possible for
services to interact with one another independently.

Web Services is a realization of SOA concept, that leverages XML, JSON, etc. and common Internet protocols such as HTTP(S), SMTP, etc.
SOA is a system-level architectural style that tries to expose business. WOA is an

interface-level architectural style that focuses on the means by which these service capabilities are exposed to consumers.

### Q3 What is SOAP?

*SOAP (*Simple Object Access Protocol*)* is a transport protocol for sending and receiving requests and responses on XML format, which can be used on top of transport protocols such as HTTP, SMTP, UDP, etc.

### Q4 What is REST?

REST (REpresentational State Transfer) is an architectural style by which data can be transmitted over transport protocol such as HTTP(S).

### Q5  What is the difference between a REST web service and a SOAP web service?

Below are the main differences between REST and SOAP web service

- REST supports different formats like text, JSON and XML; SOAP only supports XML;

- REST works only over HTTP(S) on a transport layer; SOAP can be used different protocols on a transport layer;

- REST works with resources, each unique URL is some representation of a resource; SOAP works with operations, which implement some business logic through different interfaces;

- SOAP based reads can't be cached, for SOAP need to provide caching; REST based reads can be cached;

- SOAP supports SSL security and WS-security(Web Service-security); REST only supports SSL security;

- SOAP supports ACID (Atomicity, Consistency, Isolation, Durability); REST supports transactions, but it is neither ACID compliant nor can provide two phase commit.

## Q6 How to decide which one of web service to use REST or SOAP?

"REST vs SOAP" we can rephrased to "Simplicity vs Standard". Of course, "Simplicity" with REST at most cases wins, it wins in performance, scalability and support for multiple data formats, but SOAP is favored where service requires comprehensive support for security (WS-security) and transactional safety (ACID).

**"SOAP"**

## Q7 What is WSDL?

WSDL (Web Services Description Language) is an XML format for describing web services and how to access them.

## Q8 What is JAX-WS?

JAX-WS (Java API for XML Web Services) is a set of APIs for creating web services in XML format.

### Q9 What is JAXB?

JAXB (Java Architecture for XML Binding) is a Java standard that defines how Java objects are converted from and to XML. It makes reading and writing of XML via Java relatively easy.

### Q10 Can we send soap messages with attachments?

Yes, we can send different formats such as PDF document, image or other binary file with soap messages as an attachment. Messages send using the binary data. SOAP messages is attached with MIME extensions that come in multipart/related.
An example:
MIME-Version: 1.0
Content-Type: Multipart/Related;
boundary=MIME_boundary;
type=text/xml;
        start="<claim061400a.xml@
javahungry.com>"
Content-Description: This is the optional message description.
<?xml version='1.0' ?>
<SOAP-ENV:Envelope
xmlns:SOAP-
ENV="http://schemas.xmlsoap.org/soap/
envelope/">
<SOAP-ENV:Body>
..
<theSignedForm
href="cid:claim061400a.tiff@javahungry.
com"/>
..
</SOAP-ENV:Body>
</SOAP-ENV:Envelope>

--MIME_boundary
Content-Type: image/tiff

Content-Transfer-Encoding: binary
Content-ID:
<claim061400a.tiff@javahungry.com>

...binary TIFF image...
--MIME_boundary—

## Q11 What is MTOM?

MTOM (Message Transmission Optimization Mechanism) is a mechanism for transmitting large binary attachments with SOAP messages as raw bytes, allowing for smaller messages.

## Q12 What is XOP?

XOP (XML-binary Optimized Packaging) is a mechanism defined for the serialization of XML Information Sets that contain binary data, as well as deserialization back into the XML Information Set.

## Q13 What is a SOAP envelope element?

SOAP envelop element is the root element of a SOAP message which defines the XML document as a SOAP message.
An example:
```
<?xml version="1.0"?>
<soap:Envelope
xmlns:soap="http://www.w3.org/2001/12/
soap-envelope"
soap:encodingStyle="http://www.w3.org/
2001/12/soap-encoding">
  ...
  Message information
```

```
    ...
</soap:Envelope>
```

## Q14 What does a SOAP namespace defines?

SOAP *namespace* defines the Envelope as a *SOAP* Envelope.
An example:
xmlns:soap=http://www.w3.org/2001/12/soap-envelope

## Q15 What is the SOAP encoding?

SOAP encoding is a method for structuring the request which is suggested within the SOAP specification, known as the SOAP serialization.

## Q16 What does SOAP encodingStyle attribute defines?

SOAP encodingStyle defines the serialization rules used in a SOAP message. This attribute may appear on any element, and is scoped to that element's contents and all child elements not themselves containing such an attribute. There is no default encoding defined for a SOAP message.
An example:
SOAP-ENV:encodingStyle="http://www.w3.org/2001/12/soap-encoding"

## Q17 What are 2 styles web service's endpoint by using JAX-WS?

- RPC (remote procedure call) style web service in JAX-WS;

- document style web service in JAX-WS.

## Q18 What is encoding rules for header entries?

- a header entry is identified by its fully qualified element name, which consists of the namespace URI and the local name. All immediate child elements of the SOAP Header element must be namespace-qualified.
- the SOAP encodingStyle attribute may be used to indicate the encoding style used for the header entries.
- the SOAP mustUnderstand attribute and SOAP actor attribute may be used to indicate how to process the entry and by whom.

## Q19 What is the wsimport tool?

The wsimport tool is used to parse an existing Web Services Description Language (WSDL) file and generate required files (JAX-WS portable artifacts) for web service client to access the published web services: https://docs.oracle.com/javase/6/docs/technotes/tools/share/wsimport.html

## Q20 What is the wsgen tool?

The wsgen tool is used to parse an existing web service implementation class and generates required files (JAX-WS portable artifacts) for web service deployment:

http://docs.oracle.com/javase/6/docs/tec
hnotes/tools/share/wsgen.html

- What the tool are required to test
  SOAP services?

    SOAPUI tool for SOAP WS:
http://www.soapui.org/

## Q21 What is the difference between SOAP and other remote access techniques?

- SOAP is simple to use and it is non -
  symmetrical unlike DCOM or CORBA
  is highly popular and usually have
  complexity in them.
- SOAP provides greater platform
  independent with the language
  independence unlike DCOM or
  CORBA doesn't provide any of these.
- SOAP uses HTTP as its transport
  protocol and the data are being saved
  in XML format that can be ready by
  human, whereas DCOM or CORBA
  have their own binary formats that are
  used to transport the data in
  complicated manner.
  SOAP identify the object other than
  URL endpoint. SOAP objects are
  stateless and it is hard to maintain
  that. Whereas, it is not hard to
  maintain in case of other remote
  access techniques.

## "REST"

## Q22 What is a resource in a REST?

    A resource is a unique URL with
representation of an object which we can

get contents via GET and modify via PUT, POST, DELETE.

## Q23 What are HTTP methods supported by REST?

- GET;
- POST;
- PUT;
- DELETE;
- OPTIONS;
- HEAD.

## Q24 Whether can use GET request instead of POST to create a resource?

It is not possibly, because **GET can't change a resource.**

## Q25 What is the difference between PUT and POST?

Need to use PUT when can update a resource completely through a specific resource. For example, if know that an article resides at http://javahungry.blogspot.com/article/123, can PUT a new resource representation of this article through a PUT on this URL. If do not know the actual resource location for instance, when add a new article, can use POST. PUT is idempotent, while POST is not. It means if use PUT an object twice, it has no effect.

## Q26 What is WADL?

WADL (Web Application Description Language) is a XML description of a deployed RESTful web application.

### Q27 What are frameworks available to implement REST web services?

Jersey, Restlet, EasyRest, etc.

### Q28 What is the Restlet framework?

Restlet is a lightweight, comprehensive, open source RESTful web API framework for the Java platform.
It has advantages such as

- websocket and server-sent events support;
- HTTP/2 support;
- transparent HTTP PATCH support;
- client cache service;
- fluent APIs.

http://restlet.com/

### Q29 What is the Jersey framework?

Jersey is open source framework for developing RESTful Web Services in Java that provides support for JAX-RS APIs and serves as a JAX-RS (JSR 311 & JSR 339) Reference Implementation.
It has advantages such as

- contains support for Web Application Description Language (WADL);
- contains Jersey Test Framework which lets run and test Jersey REST services inside JUnit;
- supports for the REST MVC pattern, which would allow to return a View from Jersey services rather than just data.

https://jersey.java.net/

### Q30 What is the RESTeasy framework?

RESTeasy is a JBoss project, which implements of the JAX-RS specification. It has benefits such as

- fully certified JAX-RS implementation; supports HTTP 1.1 caching semantics including cache revalidation;
- JAXB marshalling into XML, JSON, Jackson, Fastinfoset, and Atom as well as wrappers for maps, arrays, lists, and sets of JAXB Objects;
- OAuth2 and Distributed SSO with JBoss AS7;
- rich set of providers for: XML, JSON, YAML, Fastinfoset, Multipart, XOP, Atom, etc.

http://resteasy.jboss.org/

## Q31 What is the difference between AJAX and REST?

- in Ajax, the request are sent to the server by using XMLHttpRequest objects; REST have a URL structure and a request/response pattern the revolve around the use of resources;
- Ajax eliminates the interaction between the customer and server asynchronously; REST requires the interaction between the customer and server;
- Ajax is a set of technology; REST is a type of software architecture and a method for users to request data or information from servers.

## Q32 What tool are required to test REST services?

Firefox "poster" plugin for RESTFUL services. https://addons.mozilla.org/en-

### Q33 What does a @Path annotation do?

@Path annotation binds URI pattern to a Java method.

```java
import javax.ws.rs.GET;
import javax.ws.rs.Path;
import javax.ws.rs.core.Response;

@Path("/persons")
public class PersonRestService {

@GET
public Response getPerson() {

return Response.status(200).entity("get

}

@GET
@Path("/vip")
public Response getPersonVIP() {

return Response.status(200).entity("get
 }
}
```

On calling URI: "/persons" result:
getPerson is called
On calling URI: "/persons/vip" result:
getPersonVIP is called

**Q34  What does a @PathParam do?**

@PathParam annotation injects the value of URI parameter that defined in @Path expression.

```java
import javax.ws.rs.GET;
import javax.ws.rs.Path;
import javax.ws.rs.PathParam;
import javax.ws.rs.core.Response;

@Path("/persons")
public class PersonRestService {

@GET
@Path("{id}")
public Response getPersonById(@Path

  return Response.status(200).entity("g
 }
}
```

On calling URI: "/persons/1" result:
getPersonById is called, id : 1

**Q35  What does a @QueryParam do?**

@QueryParam annotation injects URI query parameter into Java method.

```java
import java.util.List;
import javax.ws.rs.GET;
import javax.ws.rs.Path;
```

```java
import javax.ws.rs.QueryParam;
import javax.ws.rs.core.Response;

@Path("/persons")
public class PersonService {

    @GET
    @Path("/query")
    public Response getPersons(
    @QueryParam("from") int from,
    @QueryParam("to") int to,
    @QueryParam("orderBy") List<String

    return Response
      .status(200)
      .entity("getPersons is called, from : " +
    + ", orderBy" + orderBy.toString()).build(

    }
}
```

On calling URI: "/persons/query?
from=10&to=20&orderBy=age&orderBy=
name" result: getPersons is called, from :
10, to : 20, orderBy**[**age, name**]**

## Q36  What does a @MatrixParam do?

@MatrixParam are a set of
**"name=value"** in URI path.

```java
import javax.ws.rs.GET;
import javax.ws.rs.MatrixParam;
import javax.ws.rs.Path;
import javax.ws.rs.PathParam;
import javax.ws.rs.core.Response;

@Path("/books")
public class BookService {

    @GET
```

```
@Path("{year}")
public Response getBooks(@PathPara
@MatrixParam("author") String author,
@MatrixParam("country") String countr

return Response
.status(200)
.entity("getBooks is called, year : " + yea
+ ", author : " + author + ", country : " +
.build();

  }
}
```

On calling URI: "/books/2015" result:
getBooks is called, year : 2015, author :
null, country : null
On calling URI: "/books/2015;author=
doyle;country=scotland" result: getBooks
is called, year : 2015, author : doyle,
country : scotland

## Q37  What does a @FormParam do?

@FormParam bind HTML form
parameters value to a Java method.

```
import javax.ws.rs.FormParam;
import javax.ws.rs.POST;
import javax.ws.rs.Path;
import javax.ws.rs.core.Response;

@Path("/persons")
public class PersonService {

@POST
@Path("/add")
public Response addPerson(
@FormParam("name") String name,
@FormParam("age") int age) {

return Response.status(200)
```

```
.entity("addPerson is called, name : " +
.build();

  }
}
```

HTML form:

```
<html>
<body>
<form action="/persons/add"
method="post">
<p>
Name : <input type="text" name="name"
/>
</p>
<p>
Age : <input type="text" name="age" />
</p>
<input type="submit" value="Add
Person" />
</form>

</body>
</html>
```

## Q39  How to get HTTP request header in JAX-RS (2 ways)?

- inject directly with @HeaderParam;

```java
import javax.ws.rs.GET;
import javax.ws.rs.Path;
import javax.ws.rs.HeaderParam;
import javax.ws.rs.core.Response;

@Path("/persons")
```

```java
public class PersonService {

@GET
@Path("/get")
public Response getPerson(
@HeaderParam("person-agent") String

return Response.status(200)
.entity("getPerson is called, personAge
.build();

   }
 }
```

On calling URI: "/persons/get" result:
getPerson is called, personAgent :
Mozilla/5.0 (Windows NT 6.1; rv:5.0)
Gecko/20100101 Firefox/5.0
- pragmatically via @Context.

```java
import javax.ws.rs.GET;
import javax.ws.rs.Path;
import javax.ws.rs.core.Context;
import javax.ws.rs.core.HttpHeaders;
import javax.ws.rs.core.Response;

@Path("/persons")
public class PersonService {

@GET
@Path("/get")
public Response getPerson(@Context

String personAgent = headers.getReque

return Response.status(200)
.entity("getPerson is called, personAge
.build();

   }
 }
```

On calling URI: "/persons/get" result:
getPerson is called, personAgent :
Mozilla/5.0 (Windows NT 6.1; rv:5.0)
Gecko/20100101 Firefox/5.0

### Q40  How to download file in JAX-RS?

- put @Produces("?") on service method, with a Response return type. Instead "?" write a type text/plain, image/png, etc.
- set "Content-Disposition" in Response header to tell browser pop up a download box for user to download.

```java
import java.io.File;
import javax.ws.rs.GET;
import javax.ws.rs.Path;
import javax.ws.rs.Produces;
import javax.ws.rs.core.Response;
import javax.ws.rs.core.Response.Re

@Path("/image")
public class ImageService {

private static final String FILE_PATH = "

@GET
@Path("/get")
@Produces("image/png")
public Response getFile() {

File file = new File(FILE_PATH);

ResponseBuilder response = Response
response.header("Content-Disposition",
"attachment; filename=image_from_ser
return response.build();
 }
 }
```

Please mention in the comments if you have any doubts regarding java web services interview questions and answers.

Just to clarify on Q24 and Q25, the methods DO NOT restrict or allow in any way what you implement, the theory is of course to use GET, PUT, POST, etc in certain way. However, if you or someone else wants to make a modification to the application in the GET implementation, they WILL do it and there's nothing that can stop it.

if there are same path given for 2 different
rest APIs then which one will be called
